

# INFINIUM OPTIMIZATION REVIEW

## INFINIUM OPTIMIZATION REVIEW

As a business leader you know how important it is to have confidence that your Infinium systems are supporting your business. One of the prime reasons for having these systems is to ensure you have the information you need, when you need it. If you're not getting this from your current configuration of Infinium, you have several choices, such as:

- Do nothing about it; therefore, continuing to rely heavily on other secondary applications like spreadsheets, databases, and other reporting tools to get what you need.
- Plan on a replacement system, set up a multimillion dollar budget, and hope that in a few years you'll get the information you need after you endure the system migration.
- Review and update your existing systems, at a fraction of the cost of a new system, to ensure you are executing business processes in an optimal way, and have the information you need, today.

There are several areas where you should be looking for improvements in your Infinium systems to improve your return on investment, such as; data clean up, data integrity, advanced web technology, and up-to-date business practices with current business models.

Schedule an optimization review with a trusted consultant on your existing Infinium systems. An Optimization Review should be designed to diagnose problems and suggest solutions. Initially, the review would include an evaluation of your current business practices and procedures, a review of future business needs, an assessment of your current Infinium system configurations, a detailed reporting of findings, and a suggested plan of action.

Optimization Reviews should identify, and provide solutions for, issues such as: untrained business users, out of date documentation, procedures that don't support business practices, redundant systems, configurations that don't match current business needs, incomplete implementations, and expensive custom programs that mimic functionality delivered in your existing applications. Once you have your findings, you can work with your consultant or independently to remedy concerns, train appropriate staff, and adjust procedures.

Your business constantly changes, and employee turnover is on the rise. Just as your people and practices change, so should how you use your software. You might not need to reinvent the wheel with a multi-million dollar software migration; you may just require a tweaking of your current system to significantly increase your return on investment.
